

Contamination Hot Spots

PathSpot Hand Scanners Have completed more than 2.5 million scans!

Here are the top contamination hotspots we see:

#1 Thumb Nails

The thumbnails, specifically the ridge along the nail, is the most contaminated. Be sure to scrub this area well. It's very easily missed.

#2 Pointer Finger

The tips of our pointer fingers are used for everything! From POS systems, to buttons on ovens, fryers, etc. It is very easy to pick up contamination from the world around you on your pointer fingers.

#3 Finger Webbing

The webbing between the middle, and ring finger hide the most contamination. Spread your fingers and be sure to lather up between them.

Reminder! Jewelry, rings, and artificial nails should not be worn while handling food.
